Application No.: 10/658,338 Inventor: Bosse

Request for Continued Examination in Response to O.A. dated 02-05-2007

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claims 1-14 (canceled)

Claim 15 (previously presented): A lock removal tool, comprising:

an elongated bar having a first end and a second end:

a lock cutting tool disposed on the first end of said bar, the lock cutting tool being a generally

rectangular, flat plate having leading and trailing edges and top and bottom surfaces, said bar being joined to

the lock cutting tool generally between the leading and trailing edges, said bar being angled away from the top

surface and extending rearward from the lock cutting tool;

a tool piece extending from the second end of said bar axially aligned with said bar;

a first impact collar disposed on said bar near the first end and substantially near said trailing edge of

said lock cutting tool, so as to form a space between said first impact collar and said trailing edge of said lock

cutting tool to accommodate a metal bar;

a second impact collar disposed on said bar near the second end; and

a weight slidably disposed on said bar between the first and the second impact collars.

Claim 16 (previously presented): The lock removal tool according to Claim 15, wherein said tool piece

comprises a length of metal stock.

Request for Continued Examination in Response to O.A. dated 02-05-2007

Claim 17 (previously presented): The lock removal tool according to Claim 15, wherein said metal stock is

square.

Claim 18 (previously presented): The lock removal tool according to Claim 15, wherein said metal stock is

tapered to define a blade.

Claim 19 (previously presented): The lock removal tool according to Claim 15, wherein the second end of said

bar has a tool piece receptacle defined therein and a threaded set serew aperture formed through the bar and

extending into the receptacle, the lock removal tool further comprising a set screw engaging the set screw

aperture, whereby said tool piece is removably retained within said tool piece receptacle by said set screw.

Claim 20 (previously presented): The lock removal tool according to Claim 15, wherein the leading edge of

said lock cutting tool is bifurcated to form a cutting slot, the cutting slot being a generally "V" shaped slot

having inner edges.

Claim 21 (previously presented): The lock removal tool according to Claim 15, wherein said top surface of

said lock cutting tool is tapered along the leading edge.

Claim 22 (previously presented): The lock removal tool according to Claim 15, wherein the leading edge of

said lock cutting tool is bifurcated to form a cutting slot, the cutting slot being a generally "V" shaped slot

having inner edges, the top surface of said cutting tool being tapered along the inner edges of said cutting slot.

Inventor: Bosse

Request for Continued Examination in Response to O.A. dated 02-05-2007

Claim 23 (previously presented): The lock removal tool according to Claim 15, wherein the top surface of said

lock cutting tool is tapered along the trailing edge.

Claim 24 (previously presented): The lock removal tool according to Claim 15, wherein the bottom surface of

said cutting tool is curved at the leading edge.

Claim 25 (previously presented): The lock removal tool according to Claim 15, wherein said cutting tool has at

least one groove formed in the top surface, the at least one groove extending transversely across the top

surface.

Claim 26 (previously presented): The lock removal tool according to Claim 15, wherein said cutting tool has at

least one groove formed in the bottom surface, the at least one groove extending transversely across the bottom

surface.

Claim 27 (previously presented): The lock removal tool according to Claim 15, wherein said bar and said lock

cutting tool are joined at an angle of between 15° and 45°.

Claim 28 (new): A method for removing a lock in combination with a lock cutting tool, said lock removal tool

comprising:

an elongated bar having a first end and a second end;

a lock cutting tool disposed on the first end of said bar, the lock cutting tool being a generally

rectangular, flat plate having leading and trailing edges and top and bottom surfaces, said bar being joined to

the lock cutting tool generally between the leading and trailing edges, said bar being angled away from the top surface and extending rearward from the lock cutting tool;

a tool piece extending from the second end of said bar axially aligned with said bar;

a first impact collar disposed on said bar near the first end and substantially near said trailing edge of said lock cutting tool, so as to form a space between said first impact collar and said trailing edge of said lock cutting tool to accommodate a metal bar;

a second impact collar disposed on said bar near the second end; and

a weight slidably disposed on said bar between the first and the second impact collars.
